

# Assembly Project: Columns, a Tetris-Like Game

Elena Ding  
Tasfia (Ira) Ara

November 19, 2025

## 1 Instruction and Summary

1. Which milestones were implemented? Milestone 1, 2, 3
2. How to view the game: INSTRUCTIONS: specify the pixels/unit, width and height of your game, etc. NOTE: list these details in the header of your breakout.asm file too!
  - (a) Unit width/height in pixels: 8
  - (b) Display width/height in pixels: 256
  - (c) Base address for display: 0x10008000

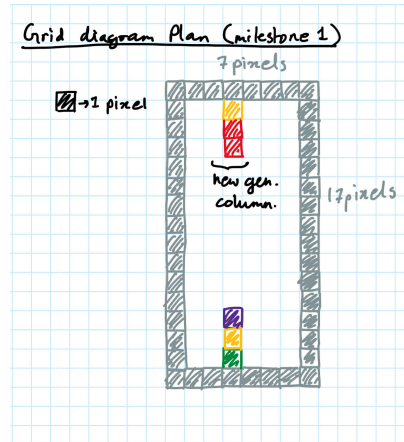

Figure 1: Grid Diagram - Mapping Out the Layout

Address	Value 16	Value 8	Value 4	Value 2	Value 1	Value 16	Value 8	Value 4	Value 2	Value 1
0x10008000	0x00000000	0x00000000	0x00000000	0x00000000	0x00000000	0x00000000	0x00000000	0x00000000	0x00000000	0x00000000
0x10008010	0x00000000	0x00000000	0x00000000	0x00000000	0x00000000	0x00000000	0x00000000	0x00000000	0x00000000	0x00000000

Figure 2: Memory Address

3. Game Summary: INSTRUCTIONS: Tell us a little about your game.
  - Columns is like simplified tetris
  - 3 randomly coloured pixels are stacked on top of each other to form a rectangle which you can control with WASD, where ASD moves the rectangle and W shuffles the colours of the rectangle

- Grid is 13 x 7
- Match 3 colours in a row, column, or diagonal to clear those blocks and make space for new rectangles
- Game is over when the rectangle hits the top and can't move downward.

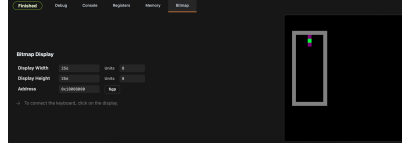

Figure 3: Milestone 1: Static Grid + First Generated Column

## 2 Attribution Table

INSTRUCTIONS: If you worked in partners, tell us who was responsible for which features. Some reweighting might be possible in cases where one group member deserves extra credit for the work they put in.

Student 1 (Elena Ding, 1011012841)	Student 2 (Tasfia (Ira) Ara, 1009854686)
Draw the first 3 gem column with random colours	Draw the grid (17*7 pixels) (milestone 1)
Implement shuffle logic with key W	Implement move left logic with key A (milestone 2)
Allow player to quit game with key q	Implement move right logic with key D (milestone 2)
When column moves into left or right side wall, keep it in same location	Implement move down (drop) one line key S (milestone 2)
When player tries to move a column left/right but another column is there, keep it in the same location	Implement collision detection to the bottom border (freezes current column when it hits the bottom border, generates a new column to manipulate) (milestone 3)
End game if gems reach the top of the grid	Implement collision detection with another column (freezes current column when it hits another column, generate a new column to manipulate) (milestone 3)
—	Detect three adjacent gems of the same colour (row, column or diagonal). If the same gem colours are detected, they are automatically removed, and other pixels in the same row and column are dropped to the lowest level (either to the border or until it hits another column). If more matches are detected after this drop along the row, column or diagonal, the pixel removal and drop process repeats until no other matches are found. Then a new column is generated for the user to manipulate. (milestone 3)
